

The-Addition Survey

Thank you to the staff at Broadlawns Medical Center in Iowa, for participating in our short but effective trial of The-addition toco pad.

- We asked the provider to monitor their patients using The-addition toco pad. The clients were required to be monitored for at least 30 minutes and having contractions prior to the toco pad being placed on the transducer.
- The gestational needed to be between 28-41 weeks OR have a BMI of 30 or greater

The questions that were asked after this trial were:

- 1) As a provider, I spent less time readjusting the transducer with The-addition.
- 2) As a provider, I obtained adequate tracing quicker with The-addition.
- 3) As a provider, the client appeared comfortable while using The-addition.
- 4) As a provider, my experience using transducers of the EFM was improved using The-addition toco pad.

Question 1: 95% agreed or strongly agreed

Question 2: 91% agreed or strongly agreed

Question 3: 100% agreed

Question 4: 95% agreed or strongly agreed.

On average, 95.25% of nurses agreed or strongly agreed that The-addition toco pad facilitated less help with readjusting transducer, improved continuous tracing, provided more comfort, and overall improved monitoring experience for provider.
