

## **The-addition Survey**

**We asked participating hospitals to fill out a survey about The-addition.**

**The guidelines for the client were as follows:**

- Client should be having contractions
- Client monitored for at least 30 minutes prior to place The-addition toco on the transducer
- Client should be between 28-41 weeks gestation **OR** client has a BMI of 30 or greater.

**Hospitals were given 4 questions to answer, with the options being:**

- Strongly Agree
- Agree
- Disagree
- Strongly Disagree

### **Survey Questions:**

- 1) As a provider, I spent less time readjusting the transducer with The-addition.
- 2) As a provider, I obtained adequate tracing quicker with The-addition.
- 3) As a provider, the client appeared comfortable while using The-addition.
- 4) As a provider, my experience using transducers of the EFM was improved using The-addition toco pad.

Question 1: 95% agreed or strongly agreed

Question2: 91% agreed or strongly agreed

Question 3: 100% agreed

Question 4: 95% agreed or strongly agreed.

On average, 95.25% of nurses agreed or strongly agreed that The-addition facilitated less help with readjusting transducer, improved continuous tracing, provided more comfort, and overall improved monitoring experience for provider.
